

**IN THE ABSTRACT:**

Please delete the existing Abstract and substitute therefor the attached Abstract.

A receiver is configured to receive a plurality of signals. The receiver includes receiving elements each of which is configured to receive a composite signal including at least some of the signals. The receiver receives the signals at the same time. The receiver also includes a processor configured to receive the receiving elements composite signal and providing an estimate of at least two of the signals. The processor is also configured to provide an estimate of a first one of the signals and to provide an estimate of a second one of the signals. The processor is configured, for each already determined estimate, to extend the estimate with a plurality of potential values. The estimate of the second one of the signals takes into account the estimate of the first signal and the estimate of the first signal is modified in dependence on the estimate of the second signal.
